Problem Statement

The Problem

The problem of gathering consistent data about time spent on various software development activities affects Martin's organization in its ability to monitor a project's progress against estimate, to invoice the customer properly, to pay contractors, and ultimately to more accurately estimate work in future projects.

- ♦ **The main parties involved are:**
 - The individual developers
 - The administrative assistant
 - The project managers

VISION STATEMENT

Vision Statement

For Martin's organization, a Personal Timing Tool (PTT) that measures time spent and collects and stores this data for later sorting and extraction- unlike "Post-it notes" and wild guesses- would enable Martin to make a systematic, consistent, and effortless assessment of where effort is spent; he could track actual versus estimated resources for a project; and he could do a better job planning for and developing future work.

- ♦ **The use-cases are:**
 - Measure time for an activity
 - Extract weekly time sheets
 - Consolidate data for a project
 - Set up a tool and database for tracking resources devote to a project
